Safety Information

Important Safety Information

Indicates procedures that must be strictly observed to prevent hazards to persons.

Indicates procedures that must be strictly observed to prevent damage to, or destruction of the product.

Emphasises additional application information and other useful information provided within these Operating Instructions.

The Oerlikon Leybold Vacuum Sogevac® SV630 B - SV750 B has been designed for safe and efficient operation when used properly and in accordance with these Operating Instructions. It is the responsibility of the user to carefully read and strictly observe all safety precautions described in this section and throughout the Operating Instructions. The Sogevac® SV630 B - SV750 B **must only be operated in the proper condition and under the conditions described in the Operating Instructions.** It must be operated and maintained by trained personnel only. Consult local, state, and national agencies regarding specific requirements and regulations. Address any further safety, operation and/or maintenance questions to our nearest office.

Failure to observe the following precautions could result in serious personal injury!

SOGEVAC® pumps are not designed:

- for pumping of aggressive, corrosive, flammable or explosive gases or gases mixtures ;
- for pumping of oxygen or other highly reactive gases with a greater concentration than atmospheric concentration (>20%) ;
- for working in flammable or explosive environment.

For all these cases, special materials must be used. In case of doubt, please contact Oerlikon Leybold Vacuum.

See also the limits of use indicated in the CE declaration of conformity.

Never expose part of the body to the vacuum. There is a danger of injury. Never operate the pump with an open and thus accessible inlet. Vacuum connections as well as oil filling and oil draining openings must not be opened during operation of the pump.

When operating pump is hot and some surfaces could reach a temperature higher than 80°C (176°F). There is a risk of burn by touching.

Depending on the process involved, dangerous substances and oil may escape from the pump. Take the necessary safety precautions !

When working on the pump system always observe the Operating Instructions.

Disconnect the unit from the power supply before starting any work.

Warning

Caution

Note

Warning

Safety Information

Warning

Take appropriate precautions to insure that the pump cannot start.

If the pump has pumped hazardous gases it will be absolutely necessary to determine the nature of the hazard involved and take the appropriate safety precautions.

Observe all safety regulations !

Take adequate safety precautions prior to opening the intake or exhaust port.

Caution

Failure to observe the following precautions could result in damage to the equipment!

Liquid and solid particles must not enter the pump. Install the adequate filters, separators and/or condensers. In case of doubt consult Oerlikon Leybold Vacuum.

The intake line of the pump must never be connected to a device with over atmospheric pressure. Design the exhaust line so that no pressure higher than 1,15 bar abs. (0,15 bar rel.) can occur.

Operating of the pump without oil or operating with incorrect direction of rotation can destroy the pump.

Note

Never use discarded seals. Always assemble using new seals.

Respect the instructions concerning environment protection when discarding used oil or exhaust filters !

The pump must be packaged in such a way that it will not be damaged during shipping, and so that no harmful substances can escape from the package.

We reserve the right to alter the design or any data given in these Operating Instructions. The illustrations are not binding.

1 Description

SOGEVAC® pumps are designed for pumping of inert gases in the range of rough vacuum, between atmospheric pressure and end pressure of the pump.

When removing condensable vapours, a gas ballast valve (or 2) must be installed.

1.1 Principle of operation

The SOGEVAC® SV630 B / SV750 B is a single-stage, oil-sealed rotary vane pump.

The anti-suckback valve, gas ballast valve, exhaust filters, oil feedback circuit, oil cooler and thermal switch are integrated functional elements of the SV630 B. The pump is driven by a foot-mounted motor via four V-belts.

The rotor mounted eccentrically in the pump cylinder has three vanes which divide the pump chamber into several compartments. The volume of each changes periodically with the rotation of the rotor.

As a result of enlargement of the pump chamber that is open in the direction of the intake port, gas is sucked in. The gas passes through the dirt trap and the open antisuckback valve and enters the pump chamber. As the rotor rotates further, the vane separates part of the pump chamber from the intake port. This part of the pump chamber is reduced, and the gas is compressed. At slightly above atmospheric pressure the gas is expelled from the chamber via the exhaust valves.

Oil injected into the pump chamber serves to seal, lubricate and cool the pump.

The oil entrained with the compressed gas is coarsely trapped in the bottom part of the oil casing. Then fine filtering occurs in the 8 integrated exhaust filter elements.

The oil trapped in the exhaust filters is returned to the stator via an oil return line. To prevent gas flowing at atmospheric pressure from the oil reservoir into the intake port, the oil return line is controlled by a float valve.

The oil cycle of the SOGEVAC® SV630 B is maintained by the pressure difference existing between the oil casing (pressure above atmospheric pressure) and the intake port (pressure below atmospheric pressure).

Unintentional venting of the vacuum chamber as well as oil suckback when switching off the pump are prevented by the built-in anti-suckback valve. Nevertheless, the anti-suckback valve does not guarantee the same safety as one valve.

As an additional failsafe device a thermal switch is incorporated ; it measures the temperature in the main oil cycle before the oil is injected into the pump chamber.

Description

Comme mesure de sécurité supplémentaire, il a été prévu en série une sécurité thermique qui contrôle la température dans le circuit principal d'huile de la pompe avant que l'huile soit injectée dans la chambre d'admission.

1) Upon request

1.8 Lubricants

The SOGEVAC® SV B pumps should be run with mineral oils for vacuum pumps with low viscosity according to ISO category VG77. The Oerlikon Leybold Vacuum oil GS77 (He-200 in the US) fulfills these specifications.

GS77 Oil : (He-200)	Conditioning	Reference
	2 l	711 17 773
	5 l	711 17 774
	20 l	711 17 775
	200 l	711 17 779

You may use other special lubricants adapted to the applications. Please consult us.

Transport and Storing

2 Transport and Storing

2.1 Transport and packaging

SOGEVAC® vacuum pumps pass a rigorous operating test in our factory and are packaged to avoid transport damages.

Please check packaging on delivery for transport damages.

Packing materials should be disposed off according to environmental laws or re-cycled. These operating instructions are part of the consignment.

The connection ports are blanked off by plastic protective caps or self-adhesives. Take these caps or self-adhesives away before turning on the pump.

The SV630 B, SV750 B, have the GS77 (He-200) mineral oil filled in.

2.2 Mounting orientation

See required space on drawings in paragraph 1.2.

Pumps which have been filled with oil must only be moved in the upright position (horizontally). Otherwise oil may escape. The angle of slope may not be over 10° max. Avoid any other orientations while moving the pump.

Only use the lifting lugs which are provided on the pump to lift the pump with the specified lifting devices.

Make sure that these have been installed safety. Use suitable lifting equipment. Make sure that all safety regulations are observed..

2.3 Storage

Before stocking the pump for a long time put it back in its original condition (blank off inlet and exhaust ports with the shipping seals, drain the oil) and store the pump in a dry place at room temperature.

Until the pump is put back in to service again, the pump should be stored in a dry place, preferably at room temperature (20 °C - 168 °F). Before taking the pump out of service, it should be properly disconnected from the vacuum system, purged with dry nitrogen and the oil should be exchange too. Drain the water from the cooling circuit (See § 3.2). The gas ballast must be closed and if the pump is to be shelved for a longer period of time is should be sealed in a plastic bag together with a desiccant (Silicagel).

If the pump has been shelved for over one year, standard maintenance must be done and the oil must be exchanged too before the pump is put in to service once more.

We recommend that you contact the service from Oerlikon Leybold Vacuum.

Caution

3 Installation

It is essential to observe the following instructions step by step to ensure safe start-up. Start-up may only be conducted by trained specialists.

The standard pump is not suitable for installation in explosion hazard areas ATEX. Please contact us, if you are planning such an application. Before installing the pump you must reliably disconnect it from the electrical power supply and prevent the pump from running up inadvertently.

Observe all safety regulations.

3.1 Installation

The SOGEVAC®s can be set up on any flat, horizontal surface. Under the four feet, there are metric threaded holes (M16x1.4) for securing the pump.

The oil level cannot be read properly if the pump is tilted and lubrication may be affected.

The pump's ambient temperature should be between 12°C (55°F) and 40°C (104°F). By modifying the pump or changing the oil type, the pump can be run at a other ambient temperature. Please consult us.

To ensure adequate cooling of the pump, leave enough space at the air intake and exhaust points, and for access and maintenance (see Fig. 1-2-3 for SV630 B/SV750 B)

Make sure to keep the air intake of the motor clean.

3.2 Connection to system

The standard pump is not suitable for installation in explosion hazard areas ATEX. Please contact us, when you are planning such an application.

Intake Side

■ Pump should be connected to inlet line without any tension. Use flex lines or pipe unions in your inlet and exhaust lines so that they can be easily removed for pump maintenance.

■ The maximum pressure at the inlet may not exceed atmospheric pressure (about 1013 mbar). Never operate the pump in the presence of over pressures at its intake.

■ Type of materials used for mounting of pipings should take care of pumped gases. It is the same for its tightness.

The pump is equipped with an inlet flange 100 ISO K/DN 100 PN 10 (SV630 B / SV750 B) or DIN 160 roots adapter (SV630 BF). Using suitable connecting elements (see § 1.4) the pump can be connected to the vacuum system.

The cross-section of the intake line should be at least the same as the one for the intake port. If the intake line is too narrow, it reduces the pumping speed.

If the process gas contains dust, it is absolutely essential to install a dust filter in addition to the dirt trap supplied (see §1.4).

Warning

Caution

Caution

Installation

We recommend to install the dust filter horizontally. This ensures that when removing the filter no particles fall into the intake port.

When pumping vapors, we recommend installing condensate traps on the intake and exhaust sides

The intake must be installed in such a way to avoid condensates flowing into the pump.

Exhaust Side

The SOGEVAC® pumps have integrated exhaust filters which, even at a high gas throughput, trap the oil mist and guarantee exhaust gas free of oil mist. If the exhaust filters are clogged, the by pass opens at 1.5 bar, (absolute pressure), and the filters are bypassed. As a result, the proportion of oil in the exhaust gas as well as the pump's oil consumption will rise. Installing new exhaust filters will correct this problem. (See § 5.4).

Check in the individual case whether an line is necessary and/or prescribed. Volatile substances will pass through the filter. Depending on the process gas, we recommend connecting an exhaust line ; this is always necessary when the exhaust gases are dangerous.

Note

The maximum exhaust pressure must neither exceed 1.15 bar absolute (0.15 bar relative), nor fall under atmosphere pressure minus 15 mbar.

Exhaust flanges

■ The SV630 B (Euro-version) and the SV750 B are not equipped with outlet flange (only hole Ø 80). An outlet pipe can be connected through accessory : Exhaust kit DN 100 PN10, 100 ISO K : Cat. Nr. 9 714 38 540.

■ SV630 BF is in standard equipped with outlet flange DN 100 ISO K.

The cross-section of the exhaust line should be at least the same as the pump's exhaust port. If the exhaust line is too narrow, overpressure or overheating may occur in the pump.

Before installing the exhaust line, remove the exhaust-flange plate and ensure that the exhaust demister(s) are secured tightly in place. They sometimes loosen during shipping and installation. A loose demister results in exhaust smoke during start-up and operation. Install the exhaust line with a downward slope to prevent condensate from flowing back into the pump. If this is not possible, we strongly recommend installing a condensate trap.

Caution

Never operate the pump with a blocked or restricted exhaust line. Before start-up, ensure that any blinds or similar shut-off devices in the exhaust line on the pressure side are opened and that the exhaust line is not obstructed.

Exhaust pipe material must be resistant to pumped gases.

Water cooling

The SOGEVAC® pumps are equipped, in standard for the SV630 BF and as an option for the SV630 B/SV750 B, with a water cooling system and a thermostatic valve. Depending on the local regulations, the cooling water needed may not be taken from the drinking water mains and max. water temperatures must be observed. The water cooling connection is made by an ARGUS type 1/2» x M22 - 150 adapter.

The thermostatic valve regulates the cooling water throughput, and so the pump temperature. The valve is set in standard on position 1.

Normally, the thermostatic valve should be set somewhere in the range from 1 to 3. Thermostat setting 1 (valve fully open) produces a low operating temperature of the pump, and setting 3 a high one.

Pumping on vapors requires setting on position 3.

Installation

Position thermo. valve		50 Hz				60 Hz			
		Ultimate pr.	40 mbar	Ultimate pr. and gas ballast	250 mbar and gas ballast	Ultimate pr.	40 mbar	Ultimate pr. and gas ballast	250 mbar and gas ballast

			Corrosion (water too soft)	Service area	Incrusting water	Very incrusting water
	PH	0	5	7,5		
			Corrosion (water too soft)	Service area	Incrusting water	

Do not use deionised cooling water.

To clean the heat exchanger : it is recommended to clean at least twice a year the water circuit.

For that, dismantle the exchanger from the pump. Chemical cleaning is the most efficient, with dilute hydrochloric acid solution (5 to 10%) then neutralize with hexamethylethyrene tetramine at 0.2 %. For a 1 mm coat of scale, leave acting the acid during about 30 min.

The system must be open during the operations, so the product gases can escape. Rinse copiously with water after neutralization.

Proceed in an open and well ventilated place.

Observe the safety regulations given by the manufacturer of the product you are using.

Observe the regulations for the treatment and the disposal of chemical products.

Observe the relevant environmental regulations.

Warning

Draining of the water-cooling circuit (before transport, long time storage, winter time).

Remove the cover Item 55 and place a water recovery pan under the heat exchanger and unscrew the plug Item 57.

The heat exchanger water will drain.

To drain completely the heat exchanger:

- Remove the water outlet hose and close the water outlet with a plug.
- Remove the water inlet hose
- Connect a compressed air supply in place of plug Item 57 and blow.

Attention, water will be evacuated through the water inlet connection.

Reassemble in the reverse sequence.

Note

3.3 Electrical connections

Ensure that incoming power to the pump is off before wiring the motor or altering the wiring.

Warning

fig. 6

Electrical connection work must only be carried out by a qualified electrician in accordance with the applicable safety rules, see IEC 60204-1.

Connect the pump's motor to the right supply voltage via the connections in the junction box (see fig. 6). The relevant safety rules require the use of a suitable motor protection switch. Set the switch in accordance with the rating on the motor nameplate.

Installation

Warning

If any security switch or electrical defect cuts out the pump, re-start-up of the pump has to be possible only manually.

Motor protection device

To protect the motor windings against a variety of operational malfunctions, the motor of the SV630 BF is fitted with protection devices.

CTP thermistors to IEC 60034-1 and DIN 44081/440823 are temperature - dependent, semi-conductor devices embedded in the motor windings.

Working principle

Non-linear variable resistors. It is recommended to connect them to the control circuit. CTP thermistors ensure a good protection against the overheating of the motor.

The pump is designed for direct starting even under load conditions, i.e. the pump can be switched on against vacuum in the intake port.

Note

After connecting the motor and after every time you alter the wiring, check the direction of rotation. Refer to the marking on the motor. During the check, the intake port should be open. If the direction of rotation is wrong, oil may be ejected out the intake port. (The vacuum system may be pressurised).

For the check, switch on the motor briefly. If it starts up with the wrong direction of rotation, switch it off immediately and interchange two phases of the connection. It is recommendable to check the direction of rotation with a phasesequenece indicator.

Caution

Prolonged running of the motor in the wrong direction of rotation will damage the pump !

Oil thermal Switch

Connection has to be made in the junction box (see fig. 7).

Breaking power on resistive circuit 250 VAC / 10 A.

To be serial wired with the coil of motor's contactor. Use an auxiliary relay.

The pump is switched off once a certain oil temperature (115 °C/239 °F) is exceeded. It is also possible to connect an alarm system. (see fig. 7).

Motorization

European versions :

A 50/60 Hz motor is mounted in standard on the SV630 B and SV630 BF.

Voltages :

400 V \pm 10% at 50 Hz

460 V \pm 10% at 60 Hz

A motor working only at 50 Hz is mounted in standard on the SV750.B

Voltage :

400 V \pm 10% at 50 Hz

Japan versions :

A JIS 50/60Hz motor is mounted in standard on the SV630 B and SV630 BF.

With CTP sensors.

Voltage :

200 V \pm 10% at 50 Hz and 60 Hz

US versions:

A NEMA motor is mounted in standard on the SV630 B and SV630 BF. With CTP sensors.

Voltages :

400 V \pm 10% at 50 Hz

230 V/460 V \pm 10% at 60 Hz

Particularities SV630 BF

The pump SV630 BF is in standard equipped with options which have to be connected before starting up the pump.

Gas Ballast (EM Valve)

Normally closed (Power supply 24 V DC \pm 10%)

To be wired in connection box (see fig. 7).

Electromagnetic valve (antisuck-back valve)

Normally open

To be supplied in 24 V DC as soon as the pump starts. Shut down power supply as the pump stops.

If several pumps with EM antisuck-back valves are operated in parallel, there is a risk in case of V belt failure that the pump oil is sucked out. This can be prevented by using a valve on the intake port controlled by a motor $\cos \varphi$ controlling device.

The rotation detector P/N 9 714 48 780 can be used as well as a retrofit or on new pumps.

Installation

The electrical options installed on the pump are wired and have their respective connection terminals installed in the connection box.

Option : Oil level monitor

Reed contact	Power supply (max.)	Breaking power on resistiv circuit
AC 0.5 A	25 V	50 VA
DC 1.0 A	60 V	50 W

To be serial wired with the coil of motor's contactor (the pump stops in case of missing oil).

You must use imperatively an auxiliary relay.

3.4 Start-up

The pumps are supplied with the necessary oil filling in ready-to-use condition. Always verify proper oil level before operating the pump.

The pump is designed for fail-safe start-up at temperatures over 12°C (55°F) (as per PNEUROP).

If local regulations provide a WYE-DELTA starting connect the pump to the system so that it can start loadfree, i.e. at atmospheric pressure in the intake port. If the vacuum system is not to be vented further measures will be necessary, e.g. a starting valve can be mounted. Please contact us in this case.

Caution

The signals of the oil level switch and exhaust filter over pressure switch must be delayed (timer) on the pump switch-on for approx. 1 minute.

SV630 BF is equipped with :

- Electromagnetic gas ballast valve 24 V DC. Connection has to be made on junction box (see fig. 7).
- Antisuckback valve driven by EM valve DC. Connection has to be made on junction box (see fig. 7).

4 Operation

4.1 Operation

To avoid overloading the motor, do not start the pump more than 6 times within one hour.

If more than 6 starts per hour are necessary keep the pump running and mount a valve which opens and closes into the intake line.

Take note of warning labels on the pump.

Warning

Pumping of non-condensable gases

If the pump system contains mainly non condensable gases, the SV630 B should be operated without gas ballast.

If the composition of the gases to be pumped is not known and if condensation in the pump cannot be ruled out, run the pump with gas ballast valve open in accordance with section below.

Pumping of condensable gases and vapors

With the gas ballast valve open and at operating temperature, the SOGEVAC® SV630.B can pump pure water vapor up to the values indicated in the Technical Data.

The gas ballast valve is opened by a screwdriver. The running noise of the pump is slightly louder if the gas ballast valve is open. Before pumping vapors ensure that the SV630 B has warmed up for approx. 30 min. with closed intake line and with open gas ballast valve.

Don't open the pump to condensable vapors until it has warmed to operating temperature ; pumping process gas with a cold pump results in vapors condensing in the oil.

For processes with a high proportion of condensable vapors, the intake line should be opened only slowly after reaching the operating temperature.

One sign of condensation of vapors in the pump is a rise of the oil level during operation of the pump.

When vapors are pumped, the pump must not be switched off immediately after completion of the process because the condensate dissolved in the pump oil may cause changes or corrosion. To prevent this, the pump must continue to operate with open gas ballast valve and closed intake port until the oil is free of condensate. We recommend operating the pump in this mode for at least 30 min. after completion of the process.

In cycle operation, the pump should not be switched off between the cycles but should continue to run with gas ballast valve open and intake port closed (if possible via a valve). Power consumption is minimal when the pump is operating at ultimate pressure.

Once all vapors have been pumped off from a process (e. g. during drying), the gas ballast valve can be closed in order to improve the ultimate pressure.

Caution

Note

Caution

Note

Operation

4.2 Switching off / Shutdown

The intake port of the SOGEVAC® SV630 B contains an anti-suckback valve which closes the intake port when the pump is switched off, thus maintaining the vacuum in the connected apparatus and preventing oil from being sucked back into the apparatus. The valve's functioning is not impaired by gas ballast operation.

If the pump has to be shutdown, drain the oil flush out the pump with fresh oil and fill in the required amount of clean oil (see § 5.4). Close the connection ports. Special preservation or flushing oils do not need to be used.

Caution

When the pump has been switched off due to over heating, initiated by the motor or its temperature detector, the pump must be cooled down to the ambient temperature, and must only be switched on again manually after having eliminated the cause.

In order to prevent the pump from running up unexpectedly after a mains power failure, the pump must be integrated in to the control system in such a way that the pump can only be started by a manually operated switch. This applies equally to emergency cut-off switches.

In case of switching processes in connection with a pump which has warmed up under operation conditions, the pump must then not be directly switched on again.

4.3 Ultimate pump pressure

If the values specified in the Technical Data are not reached in the apparatus, measure the ultimate pressure directly at the pump's intake port after disconnecting the pump from the apparatus.

The ultimate pressure of non-condensable gases (partial pressure of air) can only be measured with a compression vacuum gauge or a partial pressure gauge. Precise measurements can only be obtained with calibrated instruments.

Upon initial start-up, after prolonged idle periods or after an oil change, it takes a while until the pump reaches the specified ultimate pressure. The pump has to attain its operating temperature, and the pump oil has to be degassed. We recommend operating the pump initially with the gas ballast valve open.

The ultimate pressure depends on the pump temperature and the pump oil used. The best ultimate pressures can be obtained at a low pump temperature and by using the recommended oil types.

5 Maintenance

5.1 Safety Information

Observe all safety regulations.

All work must be done by suitably trained personnel. Maintenance or repairs carried out incorrectly will affect the life and performance of the pump and may cause problems when filing warranty claims.

Never mount used seals ; always mount new seals.

5.2 Maintenance Intervals

The intervals stated in the maintenance schedule are approximate values for normal pump operation. Unfavourable ambient conditions and/or aggressive media may significantly reduce the maintenance intervals.

Maintenance job	Frequency	Section
Check the oil level	Daily	A
Check the oil condition	Depends on process	B
1st oil change	After 150 h of operation	C
Subsequent oil changes	Every 1000 h of operation or 3 months	C
Replace the oil filter	At each oil change	C
Replace the exhaust filter d'échappement	If oil mist at exhaust or annually	D
Clean the dirt trap	Monthly	E
Check the anti-suckback valve	Annually	F
Clean oil cooler	Annually	
Clean filter of gasballast	Monthly	G
Checking the float valve	When changing the exhaust filters	H
Replacing the exhaust valves	*	I
Replacing the pump module	*	J
Disassembling and reassembling the pump module	*	K
Control belts	6 months	L

* in case of specific pump servicing

To simplify the maintenance work we recommend combining several jobs.

Warning

Caution

Contamination

5.3 Oerlikon Leybold Vacuum Service

Whenever you send us in equipment, indicate whether the equipment is contaminated or is free of substances which could pose a health hazard. If it is contaminated, specify exactly which substances are involved. You must use the form we have prepared for this purpose.

Form

A copy of the form has been reproduced at the end of these Operating Instructions: "Declaration of Contamination for Compressors, Vacuum Pumps and Components". Another suitable form is available from www.oerlikon.com → Oerlikon Leybold Vacuum Systems → Documentation → Download Documents.

Attach the form to the equipment or enclose it with the equipment.

This statement detailing the type of contamination is required to satisfy legal requirements and for the protection of our employees.

We must return to the sender any equipment which is not accompanied by a contamination statement.

Caution

The pump must be packaged in such a way that it will not be damaged during shipping, and so that no harmful substances can escape from the package.

When disposing of used oil, please observe the relevant environmental regulations.

5.4 Maintenance Work

Checking the oil

A. Oil level

The pump's oil level during operation must always be between the middle and top edge of the oil-level glass (164). When necessary, switch off the pump and add the correct quantity of oil.

High oil consumption often indicates that exhaust filters are clogged (See 5.4 - D).

The oil level should be checked at least once a day.

B. Oil Condition GS77

Normally the oil is clear and transparent. If the oil darkens, it should be changed.

If gases or liquids are dissolved in the oil, the result is a deterioration of the ultimate pressure, the oil can be degassed by allowing the pump to run for about 30 min. with the intake port closed and the gas ballast valve open.

To check if oil should be changed, drain some oil via the oil-drain plug (5) into a beaker or similar container with the pump switched off but still at operating temperature.

Depending on the process involved, dangerous substances may escape from the pump and oil. Take the appropriate precautions.

Observe the safety regulations.

C. Oil Change, Replacing the Oil Filter (if installed)

Tool required :

■ oil filter key (Ref. No. 710 73 532)

Always change the oil when the pump is switched off but still at working temperature.

If there is a risk of the oil being polymerized by the connected process, change the oil immediately after operation of the pump.

Pump when operating is hot and some surfaces could reach a temperature higher than 80° C (176 °F).

There is a risk of burn by touching. Take note of the warning labels on the pump.

Unscrew the oil-drain plug (5) and let the used oil drain into a suitable container.

Observe the safety regulations.

When the flow of oil slows down, screw the oil drain plug back in, briefly switch on the pump (max. 10s) and switch it off. Remove the oil drain plug again and drain the remaining oil.

Unscrew the oil filter (168). Take a new oil filter, moisten its gasket with oil and screw it in manually.

Reinsert the oil-drain plug.

Unscrew the oil-fill plug (122) and fill the pump with fresh oil up to the bottom edge of the oil level glass, run the pump for a short time and then change the oil again.

Use suitable oil only (see Section 1.8).

Depending on the process involved dangerous substances may escape from the pump and oil. Take the appropriate precautions.

Observe the safety regulations.

Never mount used seals. Always mount new seals.

When disposing of used oil please observe the relevant environmental regulations !

Warning

Warning

Caution

Warning

Note

Maintenance

D. Replacing the exhaust filters and checking the by-pass

Tools required :

- tubular box wrench 16 mm.

When the exhaust filter elements are clogged, the integrated by-pass opens and the filters are bypassed. Oil mist at the exhaust, and/or high oil consumption are signs that the exhaust filters are clogged.

The exhaust filters must be replaced more often if subjected to increased oil cracking products at high operating temperatures and/or aggressive media.

Remove the cover (22) with gasket (106). Remove the exhaust deflector (162) by unscrewing the bolt (9).

Remove both demister support units (165) by unscrewing the nuts (11).

The exhaust filters (167) can be removed individually.

Check also the float valve (172). See § 5.4 - H.

Plug new exhaust filters (167) into the oil casing (160).

Insert carefully the demister support units (165) over the new exhaust filters (167) threaded bars (M6) and compress slightly the demister springs.

Tighten the demister support units (165) and the exhaust deflector (162). If necessary mount a new seal (106) and mount the cover (22).

Note

When disposing of used oil please observe the relevant environmental regulations !

E. Cleaning the dirt trap

Tools required :

- Open-jaw or box wrenches 10 mm, 17 mm.

A wire-mesh filter is located in the pump's intake port (43 or 67) to act as a dirt trap for impurities. It should be kept clean at all times in order to avoid reduction of the pumping capacity.

For this purpose, disconnect the intake line, remove the dirt trap from the intake port and rinse it in a suitable vessel using a solvent. Then dry it with compressed air. If the dirt trap is defective, replace it.

The cleaning intervals depend on requirements. If large amounts of abrasive materials occur, a dust filter should be fitted into the intake line (see § 1.4).

Caution

Never mount used seals ; always mount new seals.

F. Checking the anti suckback valve

SV630 B Standard version - SV750 B

Tools required :

- Tubular box wrench 19 mm.

First remove the intake line and the intake flange (42 or 67).

Remove the 4 screws and take off the intake port.

Remove the anti-suckback valve (103 and 105), the spring and the gasket. Clean all parts and check that they are in perfect condition ; if not, replace them.

If the anti-suckback valve closes too early, carefully compress the spring slightly. The top edge of the valve should be about 1 mm away from the top side of the intake port.

Reassemble in the reverse order.

Never mount used seals ; always mount new seals.

Caution

SV 630 BF

Anti-suckback valve is driven by a EM Valve 24 V DC.

G. Cleaning the gas ballast intake filter

When the pump operates with open gas ballast valve, clean the filter (127) once a month.

Release the clips on the gas ballast filter. Clean the filter using a suitable solvent. Then dry it. Reassemble in the reverse sequence.

H. Checking the float Valve

Tools required :

- Tubular box wrench SW16.
- Alen keys 4,6.

If the pressure does not fall below approx. 5 mbar (4 Torr) during pump operation, check the tightness of the float valve (172).

Remove the cover (22) by unscrewing the nuts (11) and remove the seal (106).

Remove the exhaust deflector (162) by unscrewing the bolt (9).

Remove the clip (173) and pull out the float valve (172).

Take off the gasket, clean the nozzle, check the tightness of the float valve.

Check the gaskets of the float-valve and replace them if required.

Reassemble the float-valve in reverse sequence.

Tighten the demister support units (165) and the exhaust deflector (162). If necessary mount a new seal (106) and mount the cover (22).

Maintenance

Warning

Note

Depending on the process involved, dangerous substances may escape from the pump and oil. Take the appropriate precautions.

Observe the safety regulations.

Never mount used seals ; always mount new seals.

When disposing of used oil please observe the relevant environmental regulations !

I. Replacing the exhaust valves

Required tools:

- Tubular box wrench SW16.

Remove the hood (48) by unscrewing the screws (26).

Remove the rubber mounts (44) and the screws (9).

Remove the cover (22) and the gasket (106).

By removing the nuts (11), it is possible to dismount the valve stop and valve plates (107, 108 & 109).

Replace these elements if required.

Reassemble the valve stop and valve plates (107, 108 & 109) in reverse sequence.

Warning

Note

Depending on the process involved, dangerous substances may escape from the pump and oil. Take the appropriate precautions.

Observe the safety regulations.

Never mount used seals ; always mount new seals.

When disposing of used oil please observe the relevant environmental regulations !

J. Replacing the pump module

Fully assembled pump modules are available under Ref. Nos. :
SV630 B / SV 630 BF: 9 714 37 330, SV 750 B: upon request

Consult Oerlikon Leybold Vacuum.

Depending on the process involved, dangerous substances may escape from the pump and oil. Take the appropriate precautions.

Observe the safety regulations.

Never mount used seals ; always mount new seals.

When disposing of used oil please observe the relevant environmental regulations !

Warning

Note

K. Disassembling and reassembling the pump module

Consult Oerlikon Leybold Vacuum.

Depending on the process involved, dangerous substances may escape from the pump and oil. Take the appropriate precautions.

Observe the safety regulations.

Never mount used seals ; always mount new seals.

When disposing of used oil please observe the relevant environmental regulations !

Warning

Note

L. Checking and tightening the V-belts

Tools required :

- Key 19 and 24.

Take off the hood (55 or 15).

Loosen the nuts (66) and (23) x 2. Loosen the push rod (82).

Remove the V belts.

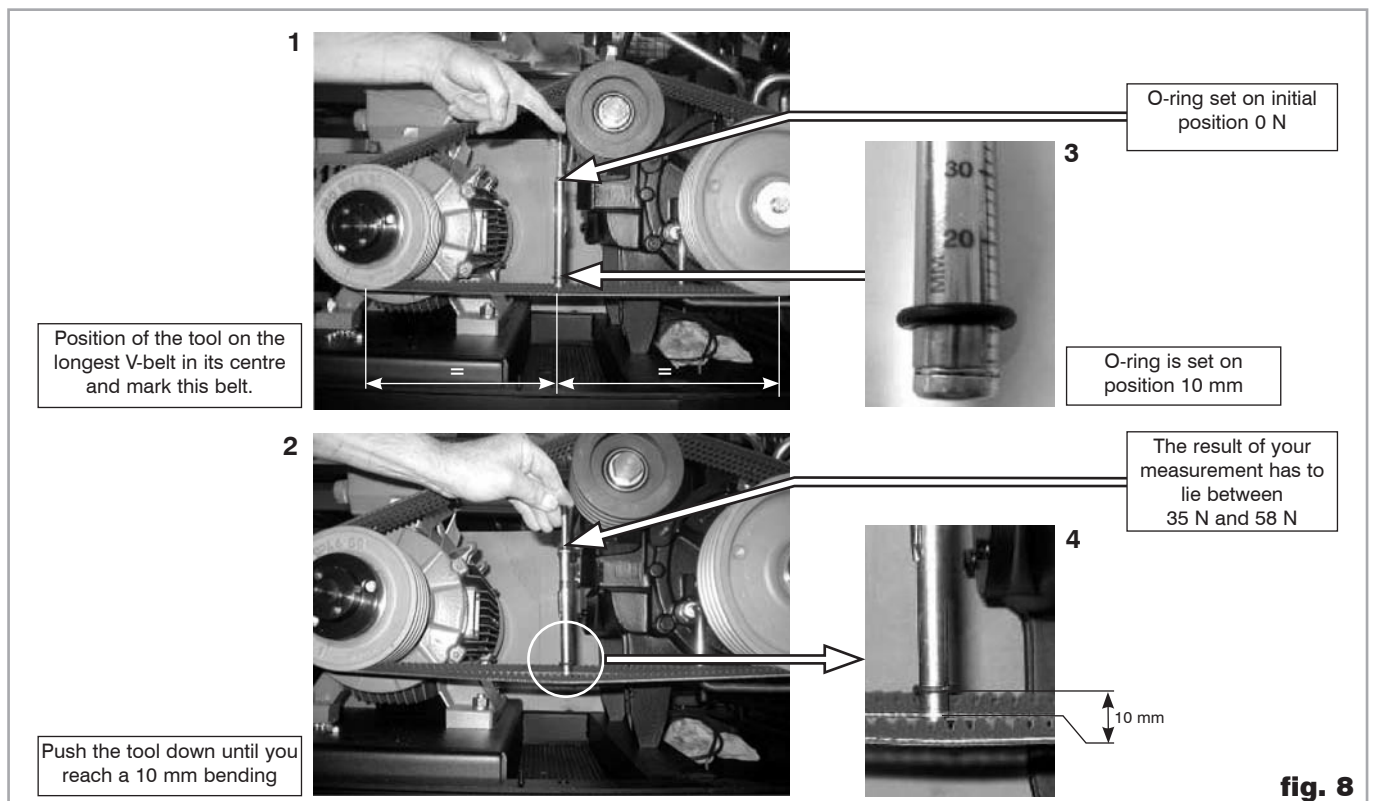

Reassemble in reverse sequence.

Stretch the V-Belts with the following method:

V-belt tension meter

This tension meter ref. 971437840 is a tool designed to check and re-tighten the v-belts

It is made of two sliding pipes with a graded spring inside.

Maintenance

How to use this v-belt tension meter :

- Set the first o-ring at 10 mm on the millimeter scale, as shown figure 8.1, picture 4, and the other o-ring on position 0 on the Newton scale.
- Install the tension meter as shown on picture 3 – figure 8, in the middle, half-way between the v-belt contacts point of the v-belts and the two pulleys.
- Push the Newton scale's black rubber down in order to reach a 10 mm bending of the v-belt (pictures 2 and 4).
- Check the result of your measurement. Tighten the belt tightener to reach the value given in table below.

The stretching of the V-belts can also be checked with a frequency meter:

- Position the tool on the longest V-belt in its centre and mark this belt.
- Place the frequency meter between the motor and generator pulleys, 10 mm above the belts.
- Strike the belt and read the frequency (Hz). Refer to the table below for the rated value.

Tightening values of the notched V-belts

Pump	Belts L (mm)	Pin	Before run-in		Re-tightening (after 10 to 24 h) (1)		Regular check (≈6 months or 3000 h.) Value under which a re-tension is necessary. *	
			Force F (N)	Frequency f (Hz)	Force F (N)	Frequency f (Hz)	Force F (N)	Frequency f (Hz)
SV630 B	1500	9 714 30 590	50	mini 69 maxi 71	45	mini 64 maxi 66	35	58
SV630 B USA/JPN	1532	9 714 37 640	50	mini 69 maxi 71	45	mini 64 maxi 66	35	58
SV750 B	1582	9 714 33 170	50	mini 65 maxi 68	45	mini 61 maxi 63	35	58

* Re-tighten with values given in column (1)

Measure always on the same belt.

ATTENTION: Do not untighten a belt if the measurement is over the value in column (1). Do not change the V-belt tension.

M. Lubricating the bearings

The SOGEVAC® pumps SV630 B, SV630 BF and SV750 B are equipped with separate grease-lubricated bearings. In normal operation the permanent-lubricated bearings are provided for 30 000 hours of maintenance-free operation.

With increased thermal load, i. e. continuous operation at high intake pressures, gas ballast operation, it is advisable to check the bearings at shorter intervals. To do so, remove the rear and front covers (97 and 136).

Test the bearing grease. If the grease is resinified, clean the bearings and change the grease.

Use high-temperature grease (ref. N° 711 17 700).

Grease quantity per bearing :

Bearing (94)	9 714 25 960	40 cm ³ ou 45 g
Bearing (139)	714 03 880	60 cm ³ ou 65 g

	Oil temperature is below 12°C (54°F).	Heat the pump and pump oil or use different oil.	1.8
	Oil is too viscous.	Use appropriate oil grade.	5.4-C
	Exhaust filter / exhaust line is clogged.	Replace the filter or clean the exhaust line.	3.4-D
Pump does not reach ultimate pressure.	Power transmission by V-belts is impaired.	Tighten or replace the V-belts.	5.4-L
	Pump is seized up	Repair the pump.	5.4-M
	Measuring technique or gauge is unsuitable.	Use correct measuring technique and gauge.	4.3
	External leak	Repair the pump.	
	Float valve does not close.	Repair the valve.	5.4-I
	Anti-suckback valve is malfunctioning.	Repair the valve.	5.4-F
	Inadequate lubrication due to:		
	■ unsuitable or contaminated oil,	Change the oil (degas it, if necessary).	5.4-C
	■ clogged oil filter,	Replace the oil filter.	5.4-C
	■ clogged oil lines.	Clean the oil casing.	
Vacuum lines are dirty.	Clean vacuum lines.		
Pump is too small.	Check the process date; replace the pump, if necessary.		
Pumping speed is too low.	Dirt trap in the intake port is clogged.	Clean the dirt trap ; Precaution : install a dust filter in intake line.	5.4-E/1.2/3.2
	Exhaust filter is clogged.	Install new filter elements.	5.4-D
	Connecting lines are too narrow or too long.	Use adequately wide and short connecting lines.	3.2
	Anti-suckback valve is hard to open.	Check spring free length.	
After switching off pump under vacuum, pressure in system rises too fast.	System has a leak.	Check the system.	
	Anti-suckback is malfunctioning.	Repair the valve.	5.4-F
Pump gets too hot	Cooling air supply is obstructed.	Set pump up correctly.	3.1
	Cooler is dirty.	Clean the cooler.	
	Ambient temperature is too high.	Set pump up correctly.	3.1
	Process gas is too hot.	Change the process.	
	Oil level is too low.	Add oil to reach the correct oil level.	5.4-C
	Oil is unsuitable.	Change the oil.	5.4-C
	Oil cycle is obstructed.	Clean or repair the oil lines.	
	Exhaust filter / exhaust line is obstructed.	Replace the exhaust filter, clean the exhaust line.	5.4-D
Pump module is no longer usable.	Replace the pump module.	5.4-K	

Troubleshooting

Fault	Possible cause	Remedy	Reference section *
Oil in intake line or in vacuum vessel.	Oil comes from the vacuum system.	Check the vacuum system.	
	Anti-suckback valve is obstructed.	Clean or repair the valve.	5.4-F
	Sealing surfaces of anti-suckback valve are damaged or dirty.	Clean or repair the intake port and valve.	5.4-F
Pump's oil consumption too high, oil mist at exhaust.	Oil level is too high.	Drain the excess oil.	5.4-C
	Exhaust filters are clogged or damaged.	Replace the filters.	5.4-D
	Nozzle of float valve is clogged.	Check the valve, clean the nozzle.	5.4-I
Oil is turbid.	Oil level is too high.	Drain the excess oil.	5.4-C
	Condensation.	Degas the oil or change the oil and clean the pump. Precaution : open the gas ballast valve or insert a condensate trap.	4.1/5.4-B
		Clean the gas ballast intake filter.	5.4-G
Pump is excessively noisy.	Oil level is very low (oil is no longer visible).	Add oil.	5.4-C
	Oil filter is clogged.	Change the oil and filter.	5.4-C
	Large vacuum leak in system.	Repair vacuum leak.	5.4-L
	Power transmission by V-belts is impaired.	Tighten or replace the V-belts.	5.4-M

* Reference section : This column refers to the section in the Operating Instructions that contains the applicable repair information.

Never mount used seals. Always mount new seals.

Spare parts

7 Spare parts

To guarantee safe operation of the Oerlikon Leybold Vacuum vacuum pump, only original spare parts and accessories should be used. When ordering spare parts and accessories, always state pump type and serial number. You can find part numbers in the spare parts list.

Consumables and main spare parts kits for SOGEVAC® pumps are usually available on stock at Oerlikon Leybold Vacuum's service centers. The list of these parts is given here after and in the spare parts table where the contents of each kits is detailed.

- Oil filter (on some models)
- Exhaust demisters
- Oil GS 77 (Special oils please refer to the specific notice of the pump or contact Oerlikon Leybold Vacuum).
- Service kit
- Set of seals
- Repair kit

We recommend to use these kits which have been defined to allow an optimal maintenance or repair. individual spare parts may need longer delivery time.

EC Conformance Declaration

We, the Oerlikon Leybold Vacuum France, declare herewith that the products listed below, in the embodiment which we have placed on the market, comply with the applicable EC guidelines.

This declaration becomes invalid if modifications are made to the product without prior consultation with use. Maintaining the EMC guideline assumes an EMC compliant installation of the component within the plant or machine.

Product type: SOGEVAC

Model designation: SV16, SV25, SV40, SV65, SV10B, SV16B, SV16BI, SV28BI, SV40BI, SV25B, SV40B, SV65B, SV100B, SV100, SV200, SV300, SV500 SV630, SV750, SV1200, SV630B, SV750B
and their variants, excepted the pumps delivered without motor and the pumps delivered with EEx... motors

The products comply to the following guidelines :

- EC Directive on machines (98/37/EC)
- EC Low-Voltage Equipment Guidelines (73/23/EMG)+(98/68/EC)
- EC Directive on Electromagnetic Compatibility (89/336/EEC)

Related, harmonized standards:

- EN 1012, 1996
Compressors and vacuum pumps, safety requirements
Part 2: Vacuum pumps
- EN 60204-1, 1997
Safety of machinery - Electrical equipment of machines
Part 1: General requirements

Limits of use:

- The pump and its accessories are not designed for pumping aggressive, flammable, explosive gases or vapors or substances, phyrophoric gases or oxidizing agents.
- The pump and its accessories are not designed for working in aggressive, flammable, or explosive ambience.
- For pumping oxygen in concentrations greater than atmospheric concentration (>20%) or other highly reactive gases, a special pump must be used. This pump must be modified and an inert oil (such as PFPE) must be used.

Contact Oerlikon Leybold Vacuum France for important safety precautions relative to these applications.

Other safety precautions and restrictions:

Refer to the manual delivered with the pumps. In any case, take adequate safety precautions.

Valence, January 12th 2007

Declaration of Contamination of Compressors, Vacuum Pumps and Components

The repair and / or servicing of compressors, vacuum pumps and components will be carried out only if a correctly completed declaration has been submitted. **Non-completion will result in delay.** The manufacturer can refuse to accept any equipment without a declaration.

A separate declaration has to be completed for each single component.

This declaration may be completed and signed only by authorised and qualified staff.

Customer/Dep./Institute: _____	Reason for return <input checked="" type="checkbox"/> applicable please mark
Address: _____	<input type="checkbox"/> Repair <input type="checkbox"/> chargeable <input type="checkbox"/> warranty
Person to contact: _____	<input type="checkbox"/> Exchange <input type="checkbox"/> chargeable <input type="checkbox"/> warranty
Phone: _____ Fax: _____	<input type="checkbox"/> exchange already arranged / received
End user: _____	Return only: <input type="checkbox"/> rent <input type="checkbox"/> loan <input type="checkbox"/> for credit
	Calibration: <input type="checkbox"/> DKD <input type="checkbox"/> Factory calibration
	<input type="checkbox"/> Quality test certificate DIN 55350-18-4.2.1

A. Description of the Leybold product	Failure description: _____
Material description: _____	Additional parts: _____
Catalog number: _____	Application Tool: _____
Serial number: _____	Application Process: _____
Type of oil (Forevacuum pumps): _____	

B. Condition of the equipment					
	No ¹⁾	Yes	No	Contamination:	No ¹⁾ Yes
1. Has the equipment been used ¹⁾	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>	oxic	<input type="checkbox"/> <input type="checkbox"/>
2. Drained (Product/service fluid)	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	corrosive	<input type="checkbox"/> <input type="checkbox"/>
3. All openings sealed airtight	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	flammable	<input type="checkbox"/> <input type="checkbox"/>
4. Purged	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	explosive ²⁾	<input type="checkbox"/> <input type="checkbox"/>
If yes which cleaning agent: _____				radioactive ²⁾	<input type="checkbox"/> <input type="checkbox"/>
and which method of cleaning: _____				microbiological ²⁾	<input type="checkbox"/> <input type="checkbox"/>
1) if answered with "No" go to D.				other harmful substances	<input type="checkbox"/> <input type="checkbox"/>

C. Description of processed substances (Please fill in absolutely)	
1. What substances have come into contact with the equipment: Trade name and / or chemical term of service fluids and substances processed, properties of the substances; According to safety data sheet (e.g. toxic, inflammable, corrosive, radioactive)	
Tradename: _____ Chemical name: _____	
a) _____	
b) _____	
c) _____	
d) _____	
2. Are these substances harmful?	No Yes
3. Dangerous decomposition products when heated?	<input type="checkbox"/> <input type="checkbox"/>
If yes, which? _____	

²⁾ Components contaminated by microbiological, explosive or radioactive products/substances will not be accepted without written evidence of decontamination.

D. Legally binding declaration

I / we hereby declare that the information supplied on this form is accurate and sufficient to judge any contamination level.
